## Radiation Sickness and Poisoning

### Guidelines for Homeopathic Prevention and Treatment

In the wake of the major earthquake and tsunami that hit Japan on Friday, an explosion has just occurred at the Fukushima nuclear power plant.

It was reported that radiation had already leaked from the plant prior to the explosion and Japanese officials now fear a meltdown with further contamination has now taken place.

People are being evacuated from surrounding areas as engineers scramble to contain the damage.

Should the situation worsen, radioactive material carried by wind and air currents may spread contaminated material to neighbouring islands and countries.

For all concerned, **there are protective steps that can be taken with homeopathy.**

Key remedies that have been used either in research or historically to prevent or treat radiation poisoning include the following:

1. Cadmium iodide
2. Cadmium-sulph
3. Phosphorus
4. Strontium-carbonicum
5. X-ray

If at risk of radiation exposure, any one of the above remedies may be taken as an emergency response, three times a day in a 30C potency. Do not exceed 6 doses without guidance from your homeopath. If radiation sickness has developed, your

homeopath can also advise on treatment dosages.

### **More Information**

The following was written for the treatment and prevention of radiotherapy and chemotherapy side-effects but the information and references it contains are just as useful and relevant to accidental radiation exposure.
